

The tower resummed: one form factor, $\pi\text{acoth}\pi a$

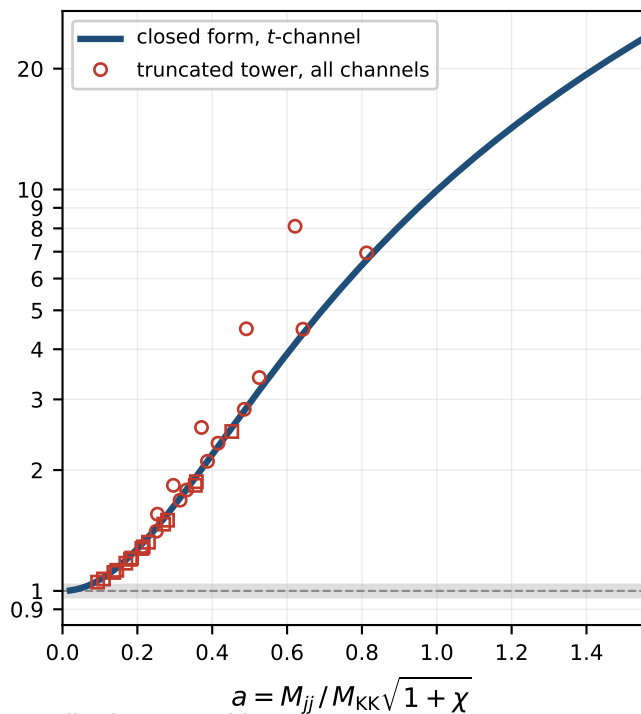

escape branch, $1/R_5 = 3.97$ TeV

ceiling at the measured mass, $1/R_5 = 9.09$ TeV

and both are the same curve

*partonic, one subprocess: gluon channels do not see the tower, and every CMS distribution is normalised per mass bin.
The 3.5% is the 3.0--3.6 TeV bin; above $M_{jj} = 7$ TeV CMS quote 12.2%*
